APPSENSE

The application that keeps learning with you

A self-learning companion for the teams who build, run, and evolve software - so the product is understood even when people change.

Code, notes, and operations orbit one living core.

THE PROBLEM

Knowledge walks out with people

Traditional support hangs on a few SMEs. When they leave, the map of the application leaves with them.

Today: incident -> find the expert -> wait -> hope they remember.

THE KEY

Knowledge remains. Always available.

AppSense holds what the application is, how it runs, and how it fails - in one place, for every team, at any hour.

No dependency on an individual SME. If someone leaves tomorrow, the next person can still learn, diagnose, and move the product forward.

HOW IT LEARNS

It adopts the app instead of waiting for a handbook

Link the code, drop in notes, scan the repo, and chat. The picture of the system keeps adapting as the application changes.

Code Base -> Scan -> Knowledge -> Skills -> Chat

WHO IT SERVES

One companion across the product lifecycle

Everyone who touches the application learns from the same living source of truth - without a knowledge-transfer meeting.

Tech support | Developers | Product owners | Ops, QA, partners

DAY TO DAY

Maintain today. Enhance tomorrow.

The same memory that walks an incident also informs the next change. Learning the app is continuous, not a one-time KT session.

Maintain: symptom -> logs + scan -> step by step -> confirm
Enhance: idea -> how it works -> risk -> ship informed

EFFORTLESS ACTION

Help without writing a KB for every step

You do not have to author a perfect wiki or preset every action. Describe a skill when useful - AppSense guides resolution from what it already knows.

Guide from what exists: code, notes, scans, and skills.

CONTROL

Human in the loop. Always.

AppSense may propose the next step. Allowlisted commands run only after a person confirms. You keep judgment; it keeps the memory.

Propose -> You review -> Confirm -> Then it runs
